

Identity · Security · Trust

The trusted digital infrastructure for organizations.

PARTNER BRIEF

Vision, ecosystem and opportunity

An overview of what IRON ID Group is building, why it matters, and where the opportunity lies — for partners considering working with us.

Prepared for	Prospective partner

Status	Confidential — for discussion purposes

1. In one page

IRON ID Group is a technology group building a complete digital infrastructure that allows companies and organizations to work, communicate, identify themselves, protect their data, and establish trust in their digital exchanges.

We are not building a collection of independent SaaS products. We are building a unified ecosystem, in which each product answers a specific need while being able to work with the others, on a single shared trust layer.

Make digital work simple. Make digital trust verifiable.

The group is organized around six products — **Workspace, Auth, Email, VPN, Box and KYC** — grouped commercially into four families and connected by a cross-cutting technology layer, **IRON ID Trust**, which handles identity, authentication, access, encryption, integrity, signature, timestamping, audit, provenance, verification and evidence.

What also sets us apart is where we come from. IRON ID is not a foreign solution translated, hosted or resold in Algeria. We are designing an infrastructure that takes Algerian realities into account from the start: the economy, the currency, the companies, the institutions, the infrastructure, digital habits and the regulatory environment. That starting point is not a limitation — it is the foundation of a technology built to expand across Africa.

THE ONE-LINE POSITIONING

IRON ID — The trusted digital infrastructure for organizations.

One infrastructure to identify, connect, work, communicate, store, share, verify, protect and prove.

Why this matters now

- Organizations are digitalizing faster than they are securing what they digitalize.
- The tools they rely on are foreign, fragmented, and priced for other economies.
- Documents circulate constantly, but almost nothing about them can be independently proven.
- Data sovereignty has moved from a technical preference to a business and institutional requirement.

2. The problem we address

Organizations today work with a scattered set of digital tools: one service for files, another for email, another for authentication, another for signature, another for identity verification or remote access. Each provides a partial answer, with its own identity model, its own access rules and its own logs.

From startups to large organizations, this produces three structural difficulties.

1 — Fragmented identity

The same employee exists in several forms across several systems. Access control becomes approximate, and offboarding someone becomes difficult to enforce with any certainty.

2 — Trust that cannot be verified

A document circulates, but nothing allows a third party to independently establish its origin, its integrity, and the validity of its signature over time. Trust rests on habit, not on proof.

3 — Structural dependency

An organization's most fundamental digital functions run on foreign platforms whose data location, access conditions and future direction it does not control — and increasingly cannot justify to its own regulators or clients.

OUR ANSWER

One unified infrastructure. One identity. One shared trust layer. And a deployment model the organization itself can control.

A market reality, not a theory

In Algeria specifically, these three problems are compounded by a fourth: the leading international platforms are difficult to purchase, difficult to pay for, priced against other economies, and designed with no regard for the local regulatory environment. Organizations are therefore forced to choose between modern tools they cannot properly buy or govern, and informal workarounds that create risk. We consider this gap to be our opportunity.

3. What we are building

Vision

To build a complete digital ecosystem allowing organizations to manage their identity, their people, their communications, their data, their connections and their digital evidence within a single infrastructure of trust.

Mission

To give organizations — Algerian first, African next — the means to work with modern digital tools without giving up control over their data, their identities and their proof.

The full cycle we intend to cover

Identify → Connect → Work → Communicate → Store → Share → Verify → Protect → Prove

Our objectives

Unify	Replace a set of disconnected tools with one coherent infrastructure, a single identity and common access rules.
Make trust verifiable	Ensure a document, an identity or an exchange can be checked independently — including outside our own tools.
Make security usable	Build products a non-technical employee can use without training, and a technical team can administer precisely.
Anchor locally	Offer pricing, an experience and a compliance framework designed for the Algerian market.
Preserve independence	Let every organization choose where its data lives and who can reach it.
Industrialize to export	Build a technology robust and flexible enough to be deployed in other African countries.

What we are not

- Not a collection of independent SaaS products sharing a brand.
- Not "one more secure Google Drive" — storage is only one piece of the system.
- Not a foreign product localized after the fact.
- Not a tool reserved for security experts — our products are built first for organizations that need to get work done.

We do not only secure data. We secure what makes it possible to trust it.

4. The ecosystem

Every IRON ID product answers a specific need and can be adopted on its own. Their real value appears when they work together: the same identity signs you into the workspace, opens the network, unlocks the vault, signs a document and sends an email. Access follows the same rules. Actions feed the same audit trail. Proof rests on the same standards.

Four commercial families

Family	Products	Need covered
IRON ID Work	Workspace	Working, collaborating, managing and signing the organization's documents
IRON ID Identity	Auth + KYC	Knowing who the user really is, and what they are entitled to
IRON ID Communication	Email	Communicating professionally, tied to the organization's identity
IRON ID Infrastructure	Box + VPN	Preserving sensitive data and securing network access
IRON ID Trust	Cross-cutting layer	Encryption, integrity, signature, timestamping, audit, provenance and evidence

A document received by email can be saved, shared, signed, certified and verified without ever leaving the ecosystem — and remain verifiable outside it.

5. The products

The six products below make up the ecosystem. Their maturity differs: Workspace is the most advanced today, and the others are being built around it and around the identity layer.

IRON ID Workspace

MOST ADVANCED TODAY

Digital Work Environment

The organization's professional workspace — where teams store, organize, share, edit and sign their documents, with the comfort of a familiar environment and the protection of a trust infrastructure. Positioning: Microsoft 365 / Google Workspace, extended by the IRON ID Trust layer.

- Files, teams and workspaces; sharing internally and with third parties
- Online editing of documents, spreadsheets and presentations; version history
- Fine-grained access control, activity tracking and audit trail
- Signing, certifying and verifying documents

The differentiator — an external partner can open a shared document in Adobe Acrobat or Microsoft Office, with no IRON ID account and no plugin, and still identify and verify the file, thanks to open standards. Trust does not depend on the other party adopting our tool.

IRON ID Auth

Identity & Access Infrastructure

The group's identity layer. It determines who the user is, which organization they belong to, what role they hold and what they are allowed to do. Every other product relies on it.

- Authentication, MFA and SSO; session management
- Users, organizations, roles and permissions
- Access policies, application identity and integration with external applications

Answers — Who are you, and what are you allowed to access?

IRON ID Email

Professional Business Communication

A professional email infrastructure integrated into the ecosystem. The point is not to offer one more mailbox, but a messaging service tied to IRON ID identity, organization and security.

- Professional addresses, individual and shared mailboxes, groups and lists
- Attachments, calendar, archiving and search
- Access control aligned with Auth; anti-abuse and anti-phishing protection
- Native integration with Workspace

The principle — email is not an isolated service; it is an extension of the organization's identity and an entry point into its workspace.

IRON ID VPN

Secure Network Access

The group's network product, allowing users and organizations to secure their connections and their access to professional resources, on site or remotely.

- Personal VPN, remote access and secure access to company resources
- Identity-based control; policies per user or per device
- Session management, access segmentation and logging

The difference — a traditional VPN applies a simple logic: User → tunnel. Integrated with IRON ID Auth, control becomes **Identity → Device → Network → Resource**. Network access stops being a master key and becomes a decision based on identity and context.

IRON ID Box

Secure Storage / Digital Vault

Box must be clearly distinguished from Workspace. Workspace is a work environment; Box is a vault. One is for producing and collaborating day to day, the other for preserving and protecting what carries particular value.

- Secure storage, digital vault, encryption and advanced access control
- Retention, archiving, versioning and protection against accidental deletion
- Audit and proof of integrity

Typical use — legal documents · financial data · evidence · identity documents · contracts · sensitive archives

IRON ID KYC

Identity Verification & Compliance

KYC verifies that a person or an organization genuinely matches their declared identity. It establishes initial trust, before the user even enters the system.

- Identity document collection, document verification and data extraction
- Selfie and liveness checks depending on the market; identity-to-document matching
- Company verification, KYC workflows and manual approval
- Audit, evidence retention and API integration

A structuring distinction — KYC answers *"Is this person really who they claim to be?"* Auth answers *"How does this verified identity access the system?"* One establishes identity; the other enforces it.

6. IRON ID Trust — the layer underneath

Behind every product sits a common layer. It is what turns a set of tools into a coherent system, and it is our most structuring technology asset. It progressively connects eleven functions:

Function	What it guarantees
Identity	The existence and uniqueness of the identity
Authentication	Proof that the identity is genuinely present
Access	What that identity may do, and in which context
Encryption	Confidentiality of data at rest and in transit
Integrity	That the content has not been altered
Signature	A person's or organization's commitment to a content
Timestamp	The certain date of an event or a document
Audit	A reliable trace of what happened
Provenance	The origin of a content and its journey
Verification	The ability to check all of the above independently
Evidence	Proof that holds up over time

Open standards, not a proprietary format

Trust is only worth something if others can verify it. We therefore build on recognized international standards rather than closed mechanisms: X.509 for certificates, Argon2 for secret protection, AES-256 for encryption, SHA-256 and ECDSA for integrity and signature, PAdES B-LTA for long-term document signatures, C2PA for content provenance, RFC 3161 for timestamping, and Merkle trees with OpenTimestamps anchoring for proof of existence.

This choice is what makes our main differentiator possible: a third party can verify an IRON ID document with their own tools — no account, no plugin, no dependency on us.

Trust must outlive the tool that produced it.

7. Built in Algeria, designed for Africa

IRON ID does not aim to be a foreign solution simply translated, sold or hosted in Algeria. Our ambition is different: to design a digital infrastructure that understands Algerian realities from the outset.

An experience adapted to the Algerian economy

IRON ID must be usable naturally by Algerian organizations. That means billing in Algerian dinars, offers adapted to local purchasing power and needs, and payment mechanisms compatible with the financial ecosystem actually available in Algeria.

An Algerian company should not have to operate like a foreign company to access modern digital infrastructure.

Regulation designed in, not bolted on

Digital transformation cannot be independent of the legal framework of the country in which it is deployed. IRON ID is therefore built with the objective of fitting the legal and regulatory requirements applicable in Algeria — particularly where it handles personal data, digital identities, documents, communications or sensitive information. We integrate the relevant requirements into the design of the products and their processes, rather than attempting to add them afterwards.

Technological independence

For us, digital sovereignty does not necessarily mean building everything alone. It means retaining the ability to choose, control, adapt and evolve your own infrastructure. We develop our products, architecture, expertise and operating capability locally, while using international standards, technologies and protocols wherever that is the right call.

That independence can cover data, identities, access, communications, storage, work tools, network infrastructure, digital evidence — and, where necessary, the hosting environment itself.

Data that stays under control

Deployment model	Description	Typical profile
National hosting	Deployed with a hosting partner in the client's own country, data remaining under its jurisdiction	Startups, SMEs, companies
Private infrastructure	Deployed on the client's own infrastructure, under its own administration	Large and public enterprises
Isolated environment	Closed network or segregated environment, for the highest security requirements	Institutions, sensitive sectors

Your data should remain under your control.

An organization must be able to know where its data is, who can access it, how it is protected and what happens to it.

From Algeria to Africa

Our Algerian anchoring is not a geographical limit. It is our starting point. We want to build in Algeria a technology robust, flexible and industrialized enough to then be deployed in other African countries, adapted to their own legal frameworks, economies, infrastructure and needs.

Made in El Djazair → Built for Africa → Ready for the world

8. Who we serve

Segment	Primary need	Natural entry point
Startups	An immediately professional foundation without administrative complexity	Workspace + Auth
SMEs	Replacing scattered tools with a single, governed environment	Workspace + Email
Large enterprises	Access control, traceability, compliance and document governance	Auth + Workspace + Box
Public enterprises	Data sovereignty and controlled hosting	Full private deployment
Institutions and administrations	Verified identity, enforceable proof, archiving	KYC + Box + Trust
Development groups and projects	A secure work environment for distributed teams	Workspace + VPN

What it looks like in practice

- **Onboarding an employee.** Identity verified, account created, rights granted, network access opened and mailbox activated — from a single administration point, and closed the same way on departure.
- **Getting a contract signed by an external partner.** Shared from Workspace, signed and timestamped, then verifiable by the partner with their own tools and no IRON ID account.
- **Preserving a document with evidentiary value.** Stored in Box, encrypted, versioned, protected against accidental deletion and accompanied by proof of integrity.
- **Opening remote access for a contractor.** Granted through VPN based on identity and device, limited to the required resources, logged and revocable.
- **Verifying a client or a company.** A KYC journey that collects, checks and retains evidence, with manual approval and API integration into the existing system.

How we are different

Product	Market category	What IRON ID adds
Workspace	Office and collaboration suites	Built-in signature, certification and verification; sovereign deployment
Auth	Identity and access management	One identity shared across work, network, storage and email
Email	Professional messaging	Email tied to organizational identity and connected to the workspace
VPN	Secure network access	Access decided by identity and device, not by a simple tunnel
Box	Secure storage and archiving	Proof of integrity and evidentiary retention, kept separate from daily work
KYC	Identity verification and compliance	Direct continuity between verified identity and access rights

9. Where a partner fits

We are building the infrastructure. What accelerates it is market access, sector knowledge and the ability to operate at scale — which is exactly where the right partner changes the trajectory.

Areas where a partnership creates leverage

Market access and distribution	Reaching startups, SMEs, large accounts and public organizations through existing relationships rather than cold entry
Sector expertise	Shaping the product for the specific requirements of regulated or document-heavy sectors
Institutional relationships	Positioning IRON ID within the country's digital transformation agenda
Hosting and operations	Local hosting capability, deployment and support for sovereign and private installations
African expansion	Country-by-country entry, with adaptation to each legal and economic framework
Commercial structure	Pricing, packaging and go-to-market for offers priced in local currency

Where we stand today

Workspace is the most advanced product in the group and carries the trust layer that the rest of the ecosystem builds on. Auth is the structural next piece, since every other product depends on it. Email, VPN, Box and KYC are defined, scoped and sequenced around that foundation. A pre-launch site is live and the brand is established; the near-term work is product depth, first deployments and the commercial structure that turns this into recurring revenue.

Our conviction

We believe Algeria should not only consume foreign digital technology. It can also design, develop, operate and export its own digital infrastructure. IRON ID wants to contribute to that shift: to build from Algeria products that meet the needs of the local market, respect its regulatory environment, work within its economy and adapt to its realities — while meeting the technology standards required to compete internationally.

IRON ID is not foreign technology adapted to Algeria. It is technology designed in Algeria, built first for Algerian realities, with the ambition of becoming a trusted infrastructure for Africa and beyond.

Let's talk.

We are happy to walk through the product live, share the technical architecture in more depth, and discuss what a partnership could look like in practice.
